

### Que 3 - Naive Bayes model using TF-IDF Vectors for Unigram+Bigram

|                                            |                       | Training     | Testing |
|--------------------------------------------|-----------------------|--------------|---------|
| Evaluate the Naive Bayes Model             | Train Time            | 0.14 seconds | -       |
|                                            | F1 Score for Positive | 0.90         | 0.90    |
|                                            | F1 Score for Neutral  | 0.15         | 0.09    |
|                                            | F1 Score for Negative | 0.76         | 0.73    |
|                                            | AUC                   | 0.9257       | 0.9091  |
|                                            | Accuracy              | 0.8270       | 0.8180  |
| SMOTE + Class Weights on Naive Bayes Model | Train Time            | 0.32 seconds | -       |
|                                            | F1 Score for Positive | 0.83         | 0.86    |
|                                            | F1 Score for Neutral  | 0.73         | 0.43    |
|                                            | F1 Score for Negative | 0.80         | 0.70    |
|                                            | AUC                   | 0.9203       | 0.8913  |
|                                            | Accuracy              | 0.7851       | 0.7546  |
| Hyperparameter tuning                      | Train Time            | 3.66 seconds | -       |
|                                            | F1 Score for Positive | 0.91         | 0.90    |
|                                            | F1 Score for Neutral  | 0.22         | 0.14    |
|                                            | F1 Score for Negative | 0.76         | 0.73    |
|                                            | AUC                   | 0.9294       | 0.9078  |
|                                            | Accuracy              | 0.8342       | 0.8212  |

### Feature Engg - Name 2 features added (Categorical/Numerical Features)

- sentiment (Categorical - derived from mapping stars to Positive, Neutral, Negative).
- cleaned\_text (Categorical - preprocessed version of text with tokenization, stopword removal, and lemmatization).

### Interpretability Implemented

- Global: The analysis identifies key features influencing the model's predictions across all reviews.

### 2 Interesting Findings

- Words like "food", "service", and "place" influence all sentiments but carry different contexts (e.g., "poor service" vs. "excellent service").
- "Great" is highly indicative of Positive sentiment, showing its strong association with positive experiences.

**Type of Cross Validation performed:** 5-fold cross-validation (via cv=5 in GridSearchCV).

### Findings of Cross Validation:

The best hyperparameter ( $\alpha = 0.01$ ) was selected based on the 5-fold cross-validation, optimizing model accuracy. The cross-validation helps prevent overfitting by ensuring the model is evaluated on different subsets of the data.
