

SVM Model using word2vec (CBOW or Skipgram and any vector size from 64 to 300)

Train Time	19.59
F1 Score for Positive	0.99
F1 Score for Negative	0.78
AUC	0.89
Accuracy	0.82
Confusion Matrix Built	yes
Categorical/Numerical Features Added	Yes
Name 2 features added	review_length, sentiment_score
Cross Validation	Yes- 3 fold
Interpretability Implemented? Local or Global?	Global
2 interesting findings	1) The model struggles with predicting negative reviews, as shown by the low precision and recall for the 'negative' class in the classification report. This suggests the model has difficulty distinguishing negative sentiment from neutral or positive reviews. 2) The length of the review (sentiment_score) and the embeddings of certain words (e.g., 'time', 'one') are the most influential features. This indicates that both the sentiment score and specific terms play a major role in determining sentiment.
Test Time	0.13
F1 Score for Positive	0.90
F1 Score for Negative	0.76
AUC	0.89
Accuracy	0.81
Confusion Matrix Built	yes
